

DAMTEC® ACOUSTIC INSULATION

Damtec® impact sound reduction products are suitable for use directly under flooring, under screed or on a wooden sub-floor.

Damtec® Australasia has launched its acoustic insulation range in Australasia. Damtec® is recognized internationally as a manufacturer of ready-to-install products for impact sound reduction.

The Damtec® range of products are deemed to satisfy current BCA requirements, while only adding slightly to overall floor height. They offer outstanding impact sound deadening in residential and commercial floors, with high compressive strength and load-bearing performance. In addition, Damtec® sound reduction products can eliminate hollow clicking sounds and reverberations (floor to ceiling noise) under hard floors.

Impact sound reduction products can be loose laid – they always lie flat and will not slip during installation – or glued to the sub-floor and/or to the flooring above. They offer superior resistance to moisture absorption and rot degradation, and are environmentally friendly – made from recycled rubber, they can be recycled again. Damtec® products can be customized to suit any performance criteria.
